Initial Wireframes

Description

Our application will allow users to search through the interface of the campus post office. It will allow users to see their current ordered packages and information about them. There will also be a delivery option so that the specified user does not have to walk to the post office and instead will have their package sent to their dorm room. Users will have an account linked to their campus email. The user can then update their account page with their dorm room and dorm hall for delivered orders. Once the user clicks on their desired package and selects pickup a QR code will pop up in order for them to scan at the parcel lockers located on campus.

Screen Archetypes
